SUMMARY

Technical Product Manager with three years owning AI products end to end, engineer by background. I work close to users and to ML and backend teams alike: reading the design docs, defining the eval metrics, and making the quality, latency, cost, and reliability trade offs that turn nondeterministic model behavior into product users trust. Track record taking AI from zero to one in real world settings: a clinical recommendation tool used daily by 150+ clinicians, a multi agent LLM system that cut review time ~45%, and a platform taken from broken codebase to 250 users in five weeks.

EXPERIENCE

BlueRobins (UC Berkeley SkyDeck)

Dec 2025 – Apr 2026

Founding Engineer, Product Lead

Berkeley, CA

- Shipped v1 in 5 weeks as the founding product and engineering lead: interviewed customers and the founder to isolate the real problem, prototyped with the designer in Cursor and GitHub Copilot, and validated each build with users before and after release.
- Led 3 interns to independent feature ownership across 30+ PR reviews, set the code quality and review standards that scaled the platform to 250 users, and kept velocity high with tight documentation and relentless feedback loops.
- Drove core product calls with the CEO and SkyDeck mentors: ran pricing experiments to find the packaging that stuck, and used product usage analytics to decide what to build, keep, and cut before scaling.
- Wrote the PRDs and shipped the build for multi role access across 4 user types and Stripe webhook handling across 7 subscription lifecycle events, powering reliable subscription commerce.

Sedna Consulting Group

May 2025 – Aug 2025

AI Operations Associate

Philadelphia, PA (Remote)

- Owned an internal AI product end to end: a multi agent RAG system (Python, FastAPI, LangChain) that auto drafts RFP responses behind human in the loop approval gates. Scoped it with the internal RFP writer, prototyped, deployed, and tuned, cutting drafting and review time ~45% (200+ hours per quarter across 10+ clients).
- Defined the approval gates and eval checks that kept generated drafts trustworthy, then demoed the tool at the NACo Conference to 37+ external stakeholders, validating product market signals and capturing qualified leads.

Apollo Trident

May 2022 – May 2025

Associate Product Manager

Dallas, TX (Remote)

- Owned the flagship override with reason feature from insight to launch on an AI clinical triage platform used daily by 150+ clinicians across 6 hospital departments: sat with clinicians, saw they overrode the model's triage recommendations with no way to capture why, then wrote the specs, partnered with engineering, and ran a 3 week pilot as the go live gate. Reason capture rose from near zero to 90%+ and recommendation acceptance lifted to ~80%.
- Turned that override signal into the team's quality loop: instrumented structured reason capture as labeled human feedback, defined the acceptance and override metrics that became our north star for recommendation quality, and used them to surface where model guidance drifted from clinical judgment.
- Cut triage intake time 65% (about 12 minutes to under 4) by iterating workflow design on user feedback, A/B testing changes, and validating each release before rollout, trading speed against clinician trust at every step.
- Influenced a roadmap call without authority: ran a demand gap analysis across 50+ clinical fields (SQL, Python), recommended reallocating staffing to three under served units, and won leadership approval, lifting patient flow throughput ~18% the next quarter.

EDUCATION

University of North Carolina at Charlotte | M.S. Computer Science, GPA 3.77 / 4.0

2023 – 2025

SKILLS

- AI Systems & Evaluation:** LLM based systems, multi agent systems, RAG, eval frameworks (offline metrics, online experiments, human feedback), prompt and pipeline iteration, hallucination, bias and drift mitigation, guardrails, human in the loop
- Product:** PRDs, specs and acceptance criteria, roadmap prioritization, trade off analysis across quality, latency, cost, reliability and UX, A/B testing and experimentation, product usage analytics, zero to one product
- Engineering & Data:** Python, FastAPI, LangChain, SQL, system design, reading and reviewing technical design docs; Tableau, Power BI, QuickSight
- Leadership & Collaboration:** founding team leadership, mentorship, stakeholder management
